

JDScience BTEC Health and Social Care Unit 1 Set B mark scheme

Original JDScience mark scheme. Indicative content only. Equivalent wording that meets the command word should be credited. Not an official Pearson paper.

Use this booklet after the matching practice paper. Do not issue it with the student paper.

Time: 1 hour 30 minutes · **Total marks:** 90

Question 1 · 26 marks

Tomasz is 24. He has started his first full-time job in a warehouse and has moved into a shared house. He is saving for driving lessons. He plays five-a-side football twice a week. He argues with his parents less than he did at 17, but he still asks them for advice about money.

(a) [2 marks]

Identify two characteristic physical features of early adulthood.

- Peak physical fitness/strength for many people; full adult height already reached; reproductive maturity; generally high energy.

(b) [4 marks]

Describe how Tomasz's intellectual development may continue in early adulthood.

- Workplace learning: procedures, time management, specialist skills.
- Practical problem-solving (budgeting, tenancy).
- Further education or training if he chooses it later.

(c) [6 marks]

Explain two emotional developments associated with early adulthood, using Tomasz as an example.

- Independence and identity as a worker, not only as a son.
- Intimate relationships / trust in housemates; still using parents as a secure base for money advice.
- Self-esteem from football and earning.

(d) [14 marks]

Discuss how entering employment can affect social development in early adulthood.

- New colleagues and shared house expand social networks beyond school friends.
- Less time for old peers; football maintains a social group.
- Adult roles and responsibilities (rent, shifts) change how he relates to parents.
- Risk: isolation if shifts clash with friends; benefit: status and belonging at work.
- Level 3: both positive and challenging social effects with a conclusion.

Question 2 · 22 marks

Priya is 47. She is a secondary school teacher. Her periods have become irregular and she has hot flushes. She cares for her father, who has Parkinson's disease, and her teenage son. She has started evening walks with a friend because she feels "stretched thin".

(a) [2 marks]

Identify two physical changes associated with perimenopause or middle adulthood.

- Irregular periods; hot flushes; possible weight redistribution; reduced fertility; joint stiffness; greying hair.

(b) [4 marks]

Outline two intellectual demands Priya may face in middle adulthood.

- Complex job (planning, behaviour management).

- Managing appointments and medication for her father.
- Supporting a teenager's schoolwork while keeping her own professional knowledge up to date.

(c) [6 marks]

Explain how being a sandwich carer may affect Priya's emotional development.

- Role strain and guilt if she feels she is not doing enough for son or father.
- Stress/anxiety from competing demands; walks with a friend as a coping strategy supporting mood.
- Possible pride and purpose from caring, alongside risk of burnout.

(d) [10 marks]

Evaluate the impact of lifestyle choices on Priya's health and development in middle adulthood.

- Evening walks: physical fitness, stress relief, social contact — protective.
- Teaching workload and night-time flushes may disrupt sleep — risk for concentration and mood.
- Diet, alcohol, screening (not given) would also matter; do not invent facts.
- Lifestyle can moderate but not remove biological change (menopause) or caring load.
- Level 3: judgement that lifestyle helps but support services may still be needed.

Question 3 · 22 marks

Kenji is 71. He retired from engineering two years ago. He volunteers in a repair café, uses a smartphone to video-call his grandchildren in Japan, and has a mild hearing loss. He had a hip replacement six months ago and now walks with a stick on uneven ground.

(a) [2 marks]

Identify two theories of ageing.

- Award 1 mark each. Examples: disengagement theory; activity theory; social/emotional selectivity; biological (wear and tear, programmed ageing). Names only are acceptable.

(b) [4 marks]

Describe how activity theory could be applied to Kenji.

- Activity theory: wellbeing in later life is supported by staying involved.
- Repair café, video calls and walking after hip surgery are roles that replace work identity.
- Contrast: if he withdrew fully, disengagement theory would predict reduced social involvement (not a good fit here).

(c) [6 marks]

Explain two ways sensory change may affect Kenji's development.

- Hearing loss: conversation at the café harder → risk of isolation unless loops/hearing aids used.
- May affect safety (traffic, alarms) and confidence walking outside.
- Video calls rely more on vision; captions could help — apply, do not list gadgets unlinked to Kenji.

(d) [10 marks]

Assess the likely effects of retirement on Kenji's PIES development.

- Physical: more time to walk/rehab, but risk of inactivity if volunteering stopped.
- Intellectual: repair café keeps problem-solving; risk of boredom if no structure.
- Emotional: loss of engineer status vs pride in volunteering and family contact.
- Social: workplace friends may fade; café and grandchildren provide new/continuing ties.
- Level 3: balanced assessment across PIES with a short overall judgement.

Question 4 · 20 marks

Leah is 4. She was born at 34 weeks. She has speech delay and attends a childminder three days a week while her parents work. Health visitors have suggested extra play sessions. Leah loves picture books but becomes frustrated when adults do not understand her.

(a) [2 marks]

Identify two features of physical development in early childhood (3–8 years).

- Improved running/jumping/climbing; tripod grasp; dressing with less help; better balance; drawing shapes.

(b) [4 marks]

Describe two possible causes of Leah's speech delay.

- Prematurity affecting early neurological/physical development.
- Limited adult conversation if both parents work long hours (environmental).
- Hearing problem should be considered (glue ear) — as a possible cause, not a diagnosis.
- Bilingual home (not stated — do not invent). Only use the case.

(c) [6 marks]

Explain how play can support Leah's intellectual and social development.

- Picture books: vocabulary, joint attention, turn-taking.
- Play sessions: pretend play → symbols, problem-solving; parallel to cooperative play with peers.
- Childminder as a consistent adult model of language.

(d) [8 marks]

Discuss how professionals could work together to support Leah's development.

- Health visitor: review development, hearing, referral.
- Speech and language therapist: strategies for parents/childminder.
- Early years setting: targeted communication games.
- Parents: reading, reducing frustration by offering choices/signs.
- Level 3: joined-up, person-centred support with a conclusion about likely benefit.
